Bulk Upload Requirements

www.supfolio.com

Available ways to import Products in SupFolio

SupFolio offers the option to upload products in four (4) different ways. Ensure your business is ready to proceed with the Bulk Upload Process. We offer all the necessary details you need to complete the Process.

Content

We serve all modern ways to import Products in our Platform

01. Manually

02. Semi-Automated (Csv or Xls file)

03. Semi-Automated (Xml or JSON file)

04. Fully-Automated (Xml file)

1. Manually Way

Every Supplier has two ways to connect and manage his Corporate account. a) Via signing in his storefront account from our website www.supfolio.com and b) Via his back office.

What kind of information manages?

SupFolio is a powerfull B2B platform which is Designed by experts and offers a wide variety of abilities at different levels.

PRODUCT'S INFORMATION

Product ID, Categories, Product Name, Product manufacturer, MPN, GTIN, min & max orders, prices, wholesale prices, quantity discounts, customers grous, shipping info

CONTENT INFORMATION

Images, Description, Overview, Secondary images, Meta keywords, Meta Description, Search Keywords,

Products features

Set as Fast movement Products, Hot Deal, Stock out Product, Stock availabilities, attributes, Estimated days of delivery, Set products available for specific groups.

Custom Features

SupFolio's Platform gives the priviledge for custom features according to our Client's needs. For custom cases customers need to come in touch with our First Level Support via Ticketing System or via Phone Call at +30 2351 800 985

Operational in 2 Different Languages

SupFolio is operational in two different languages (English and Greek). At our end we provide two template files (products and categories). The files must be fulfilled with the required information in two different languages, so in total the delivery files must be 4. a) Categories_En b) Products_En c) Categories_Gr d) Products_Gr

The whole process is extremely easy and is fully operated by Supplier's Back Office. Supplier has to enter the session "Bulk Operations / Bulk Category import" for importing his categories and "Bulk Operations / Bulk Product import" for importing his products and do the Mapping with the required fields.

2. Semi-automated way (Csv / Xls)

*Our Platform offers the privilege to import products via Csv or Xls file. *Csv must be in UTF-8 Format, comma separated*

> Required Fields for the CSV / Xls

product_id (Mandatory)

title (Mandatory)

price (Mandatory)

category_key (Mandatory)

manufacturer (optional)

meta_title (Mandatory)

meta_description (Mandatory)

meta_keywords (Mandatory)

search_keywords (Mandatory)

overview (Mandatory)

case_pack (optional)

mpn (optional)

gtin (optional)

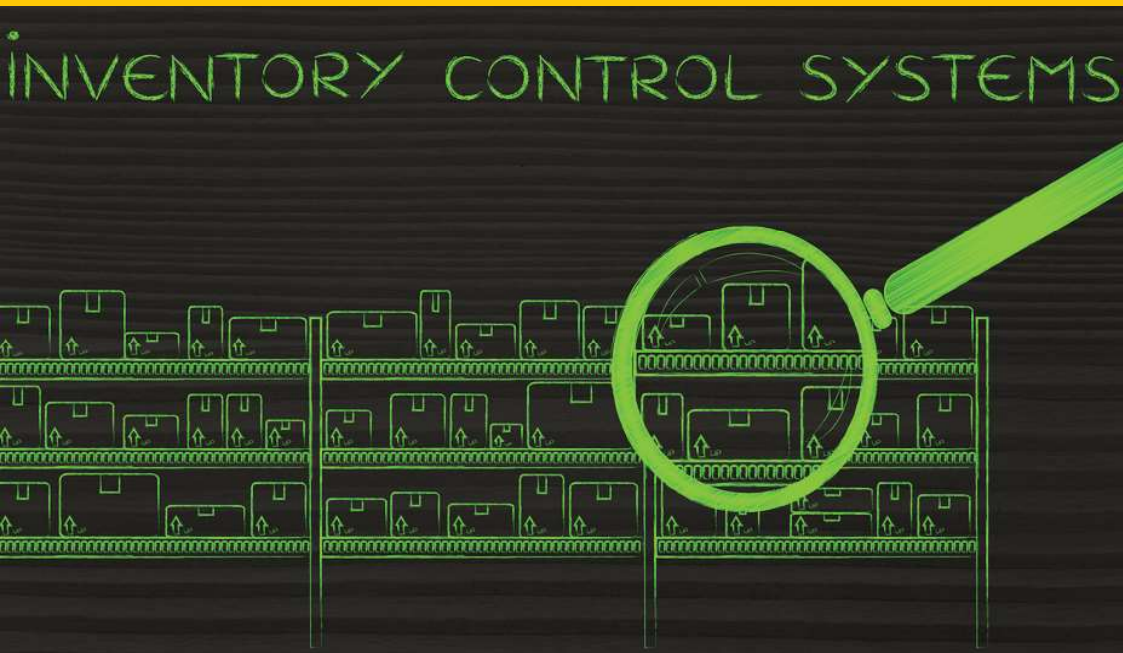

Inventory Control System

We offer additional privileges regarding the inventory control system

Except the basic variables we explained before you can have the ability to handle information regarding your stock availability at Product Level or at attributel level.

If you want to serve informations regarding the stock availability of your products then you have to add to your CSV file 4 additional variables.

- a) inventory_control
- b) stock
- c) stock_warning
- d) inventory_rule

How it works

Set inventory control enabled and inform the clients when your product is out of stock

1. inventory_control (set: Yes)

2. stock (set: number of stock)

3. stock_warning (set: 0)

4. inventory_rule (set: OutOfStock)

Inventory Control

Set value: "Yes" to enable it or "No" to disable it

Inventory Rule

Set value: "OutOfStock" and when your stock number will be lower than stock warning then the message out of stock will be displayed

Variable names

Inventory control => inventory_control

Stock => stock

Stock Warning => stock_warning

Inventory Rule => inventory_rule

*Same instructions are used for xml files cases.

Bulk Feed Importer

The bulk feed importer function is responsible for preparing the imported data for the Supplier.

Use your existing Xml

In SupFolio we accept a wide variety of xml formats like Skroutz, Doba, Showare, Woocommerce, Shopify, Google Merchant and custom cases.

Follow our Requirements

You can always see and follow our platform's requirements in the followed information.

Xml Structure

It returns a shop_data array with all relevant shop data that can be further processed through the bulk feed importer functions. Several product fields require special values, e.g. "Yes" / "No" / "0" or "1" to indicate if a value is on/off, enabled/disabled or other fixed definitions.

shop_data array

An array with product entries, see the followed detailed information

product_description array

The products language specific description, see followed detailed information

products_categories array

An array with a sorted product category structure, see followed detailed information

attributes array

An array with attribute values, see followed detailed information

Product Array

1.Reference ID

Name: reference_id
Value: Main unique product identifier in the source shop's data-base. e.g. product_id, variant_id etc
*Range: Alphanumerical (for compatibility purposes, special characters should not be used) - *Optional*

**Mandatory*

Product Description Array

22.Description

Name: description

Product's Description
(HTML tags can be used)
Range: Alphanumeric
*Optional

23.Overview

Name: overview

Product's Short overview
(HTML tags cannot be used)
Range: Alphanumeric
*Optional

24.Meta Title

Name: meta_title

Product's meta title
(HTML tags cannot be used)
Range: Alphanumeric
*Optional

25.Meta Keywords

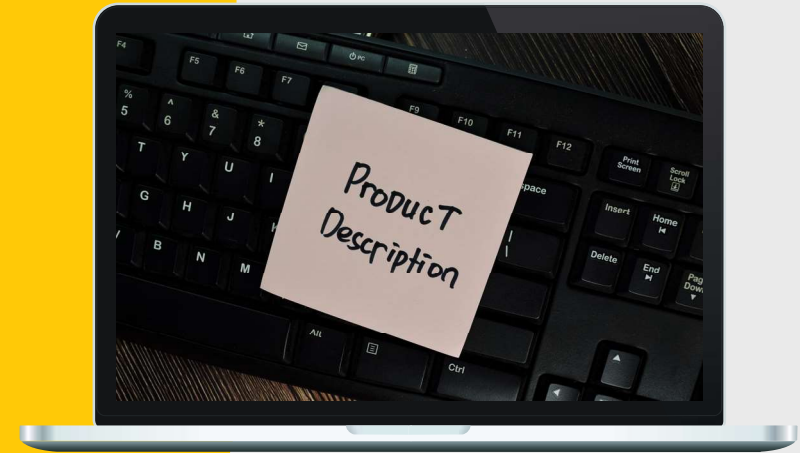

Name: meta_keywords

Product's meta keywords
Range: Alphanumeric
*Optional

26.Search Keywords

Name: search_keywords

Product's search keywords
Range: Alphanumeric
*Optional

Product Categories Array

This array is an indexed list

E.g. If the product is Located at the category "Graphics Cards" which is a subcategory of "computer components" then just locate the final subcategory (The array would have just one entry).

```
$products_categories[1]=> "Graphics Cards"
```

Product data has no category info

Use an empty array as parameter:

```
$products_catagories = array();
```
